Topics

1. Loading and running dSpace ControlDesk
2. Starting STI data acquisition
3. Rezeroing the EXV
4. Permanently storing code in the system controller (dSpace MicroAutobox)
5. Setting up instrumentation in dSpace ControlDesk
6. Setting up a data capture in ControlDesk and using the captured data
7. The control system model
8. Model variables that may require modification
9. Source code control (TortoiseSVN)
10. Hardware issues

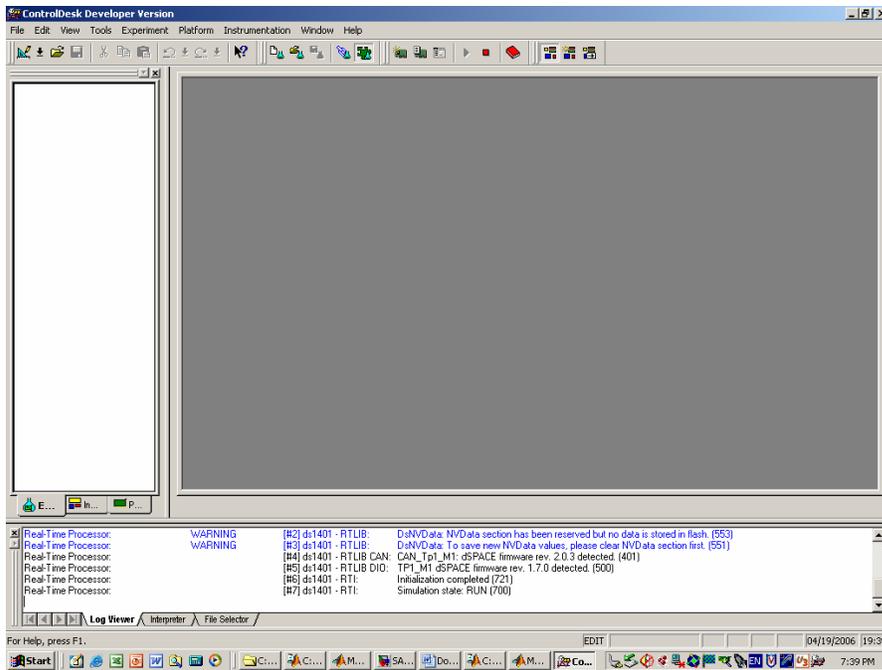

Hardware Reference

1. Loading and running dSpace ControlDesk

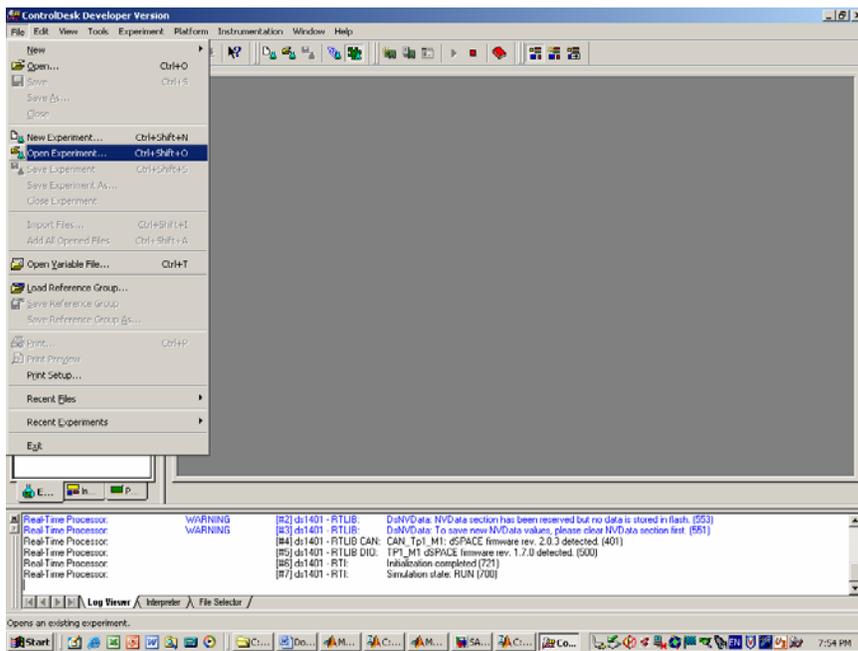

The car must be running and the communication cable must be connected between the dSpace MicroAutobox and the support PC.

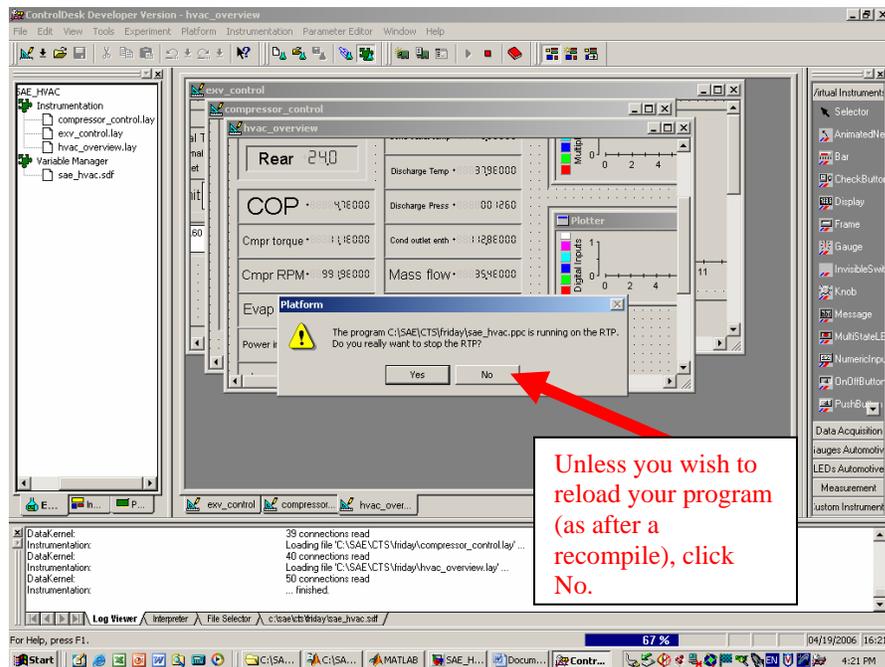

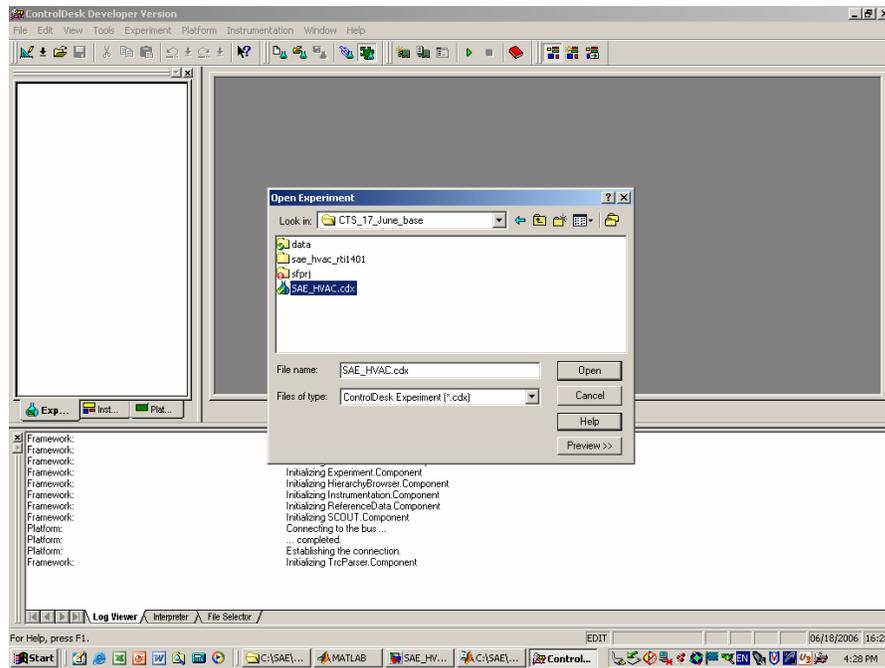

Watch for a successful start (see Log Viewer at the bottom of the page) with communication established between the PC and the dSpace MicroAutobox. The Log should end with “Simulation state: RUN”. Try restating the program if startup fails.

Next click on File, then Open Experiment

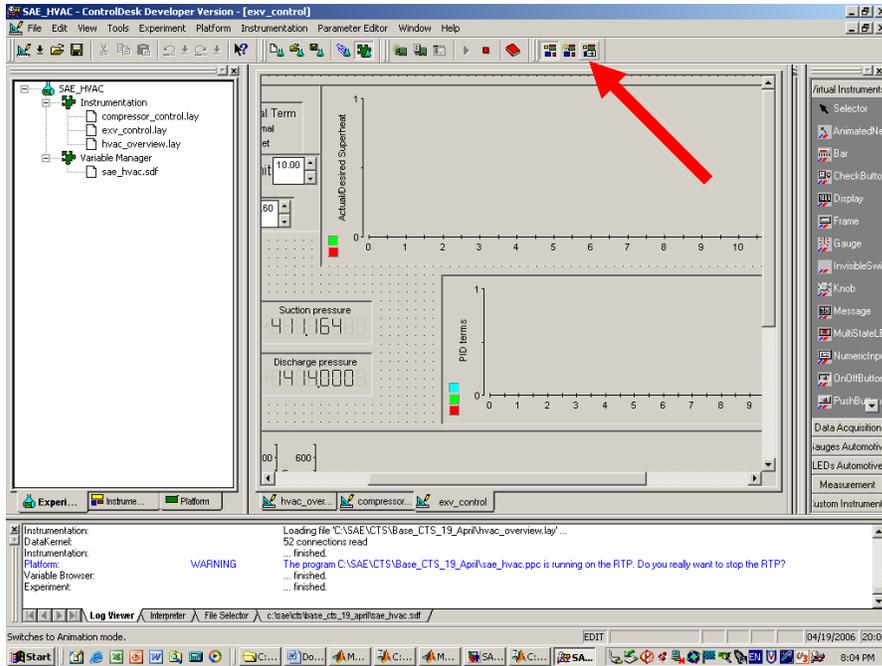

Select SAE_HVAC.cdx in the directory where your code has been compiled as shown below.

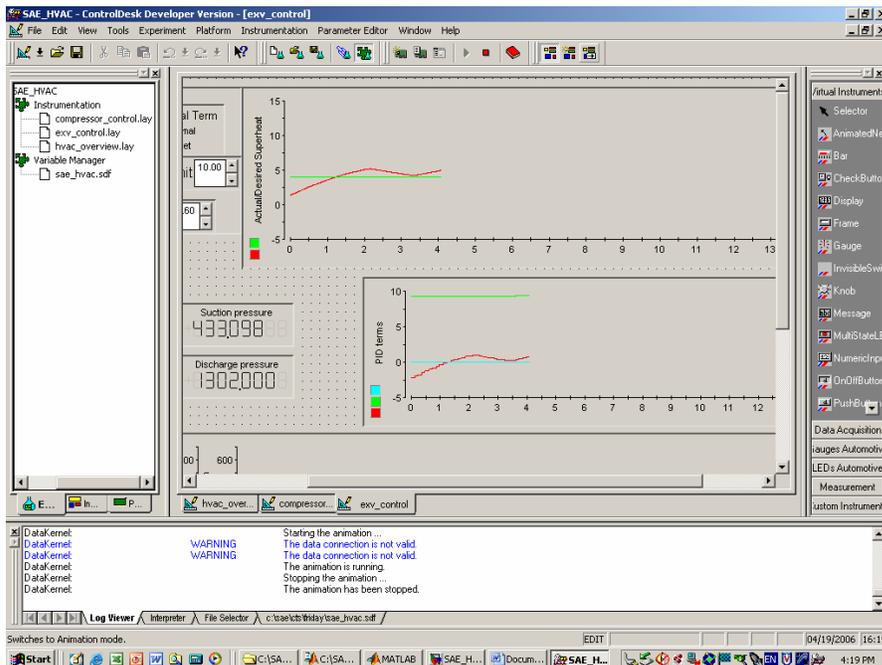

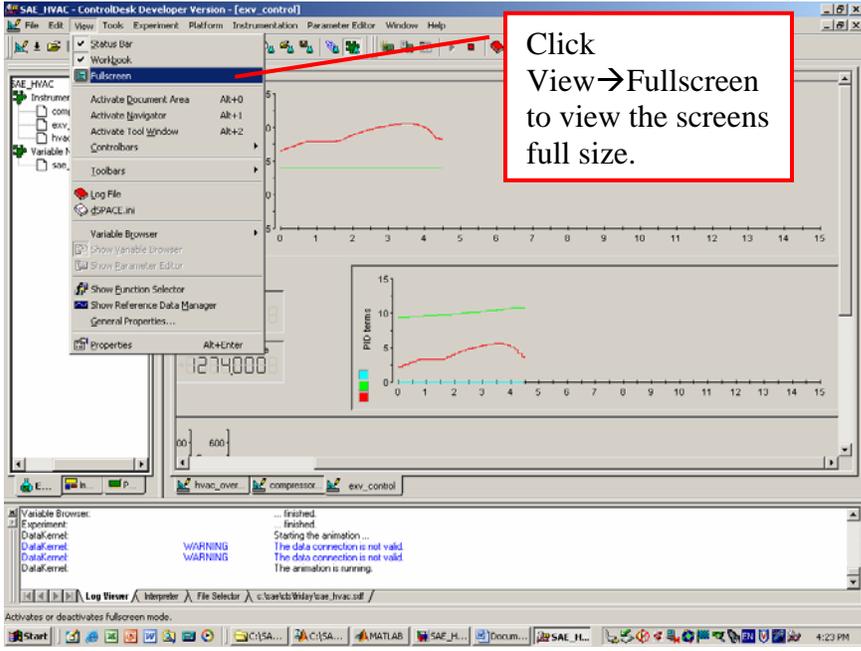

If you have recompiled and wish to reload, be certain the air conditioner is turned off and then click Yes. After a reload, be sure to rezero the EXV (see Topic 3).

The custom display screens are now visible, but data scanning is not started. The screens can be edited in this mode. Click on the icon indicated by the arrow to start updating the display screens.

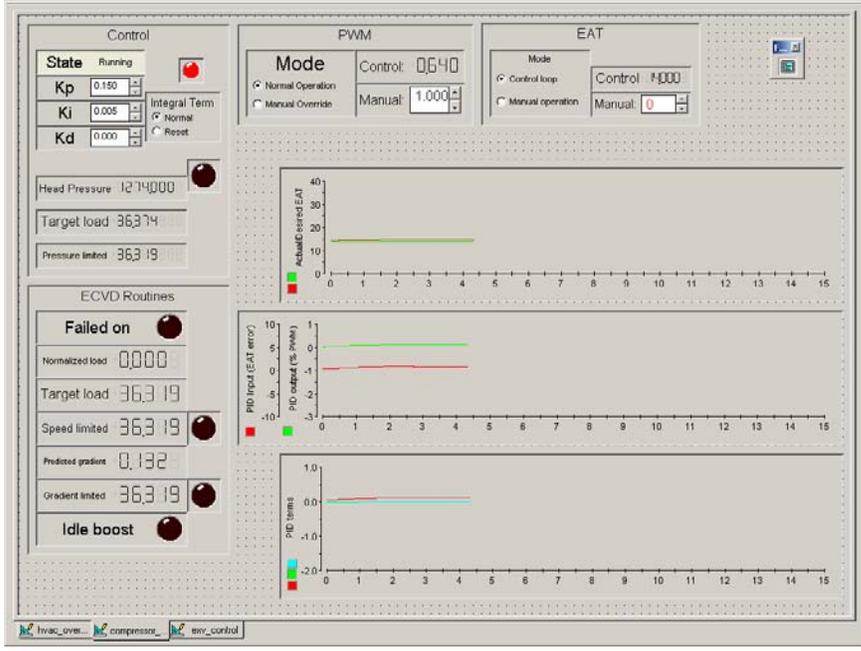

The updating EXV screen is shown below.

A full size screen appears below. Press the “Esc” key to leave the full screen mode.

2. Starting STI data acquisition

1. Connect the Panasonic support computer to the STI data acquisition system using its communication cable (see photo).

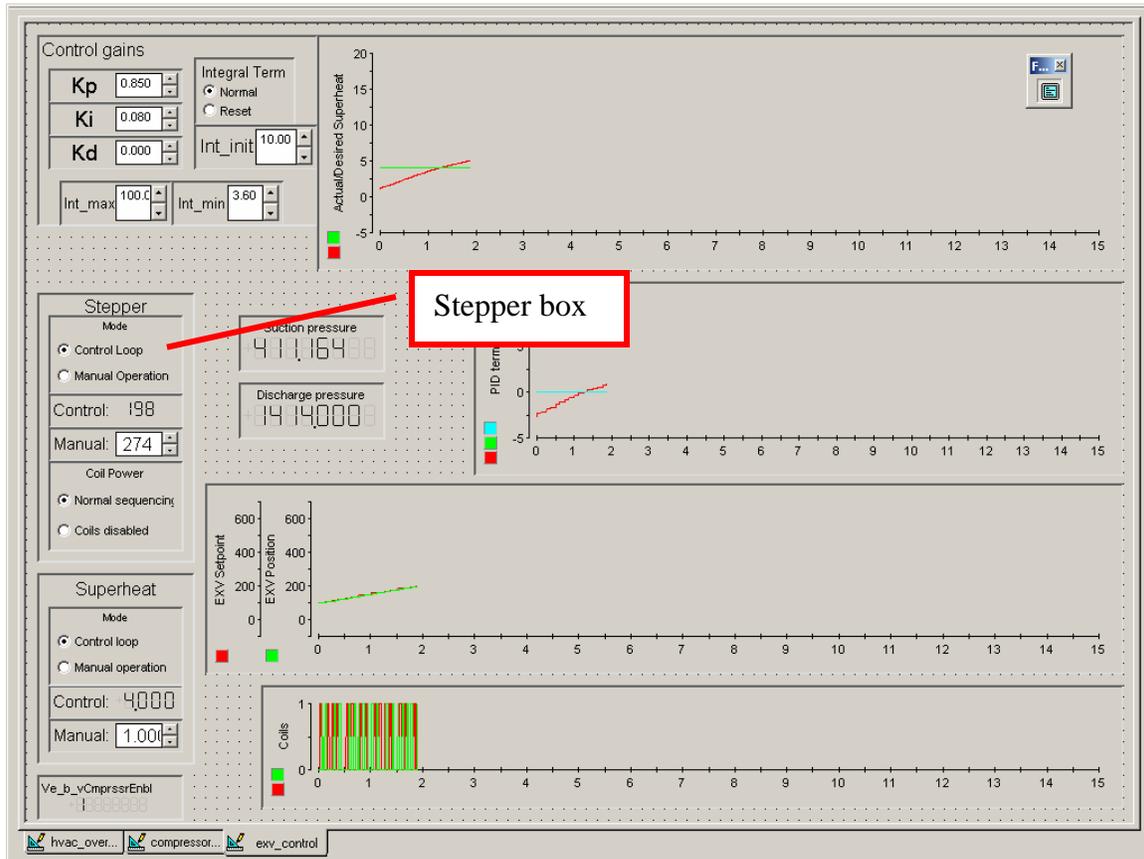

2. Click on the STI icon labeled “STI_B12c” on the desktop.
3. The STI must be powered on (box on rear tunnel of vehicle).
4. Click on File->Start Test.
5. Use the default Vehicle File and Config File.
6. Change Data File as desired. Notice the directory where it is stored. Currently the directory is C:\sti\65DP4229 2005 STS\data.
7. The screen should show all vehicle transducers.
8. Enter an integer 1, 2, 3, etc. to start saving data. The number 1 saves data at one second intervals.

9. Press F7 to stop the test and exit.
10. Open the data file you have just collected (suffix dat).
11. Click “Convert” on screen to convert file to a *.csv file compatible with Excel.

3. Rezeroing the EXV

It is advisable to rezero the EXV after loading code into the MicroAutobox. After downloading code and starting simulation, be certain the AC system is switched off (see Topic 4). The Stepper box on the left of the ControlDesk EXV screen is used to establish valve zero.

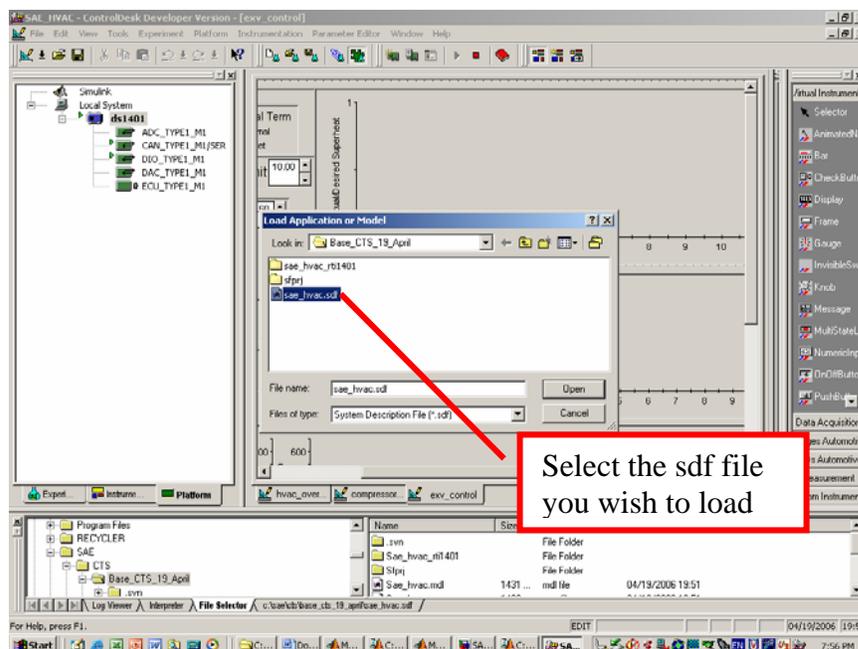

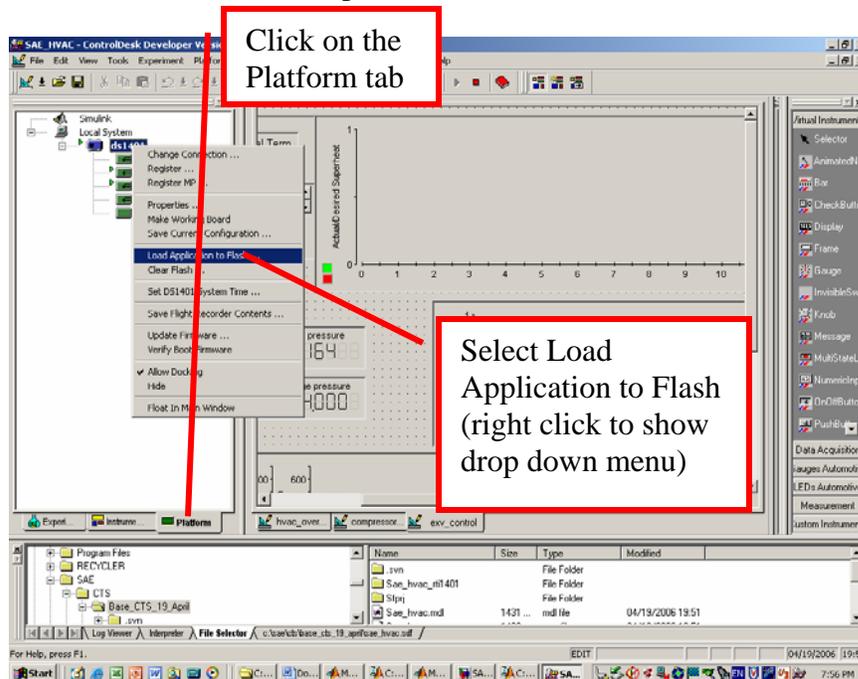

1. Note the current controlled valve position.
2. Click the button to place the valve in Manual Operating mode.
3. Set the Manual valve position to a negative number. -2000 will always completely close the valve, but -1 may be sufficient. Try something like -50 and listen for the valve tapping when fully closed. (The tapping is obvious in the car with the doors closed.) You can always use a larger negative number if your first choice does not close the valve.
4. After the valve has audibly closed and stopped tapping, click the button to disable the coils (this will prevent the motor from really turning).
5. Set the Manual valve setting to 0 and wait for the red EXV Setpoint and green EXV Position curves to converge at zero. The controller's counter and the physical valve position now match at 0.
6. Click the button to return to normal coil sequencing.
7. Set the Manual valve position to the position noted in step 1.

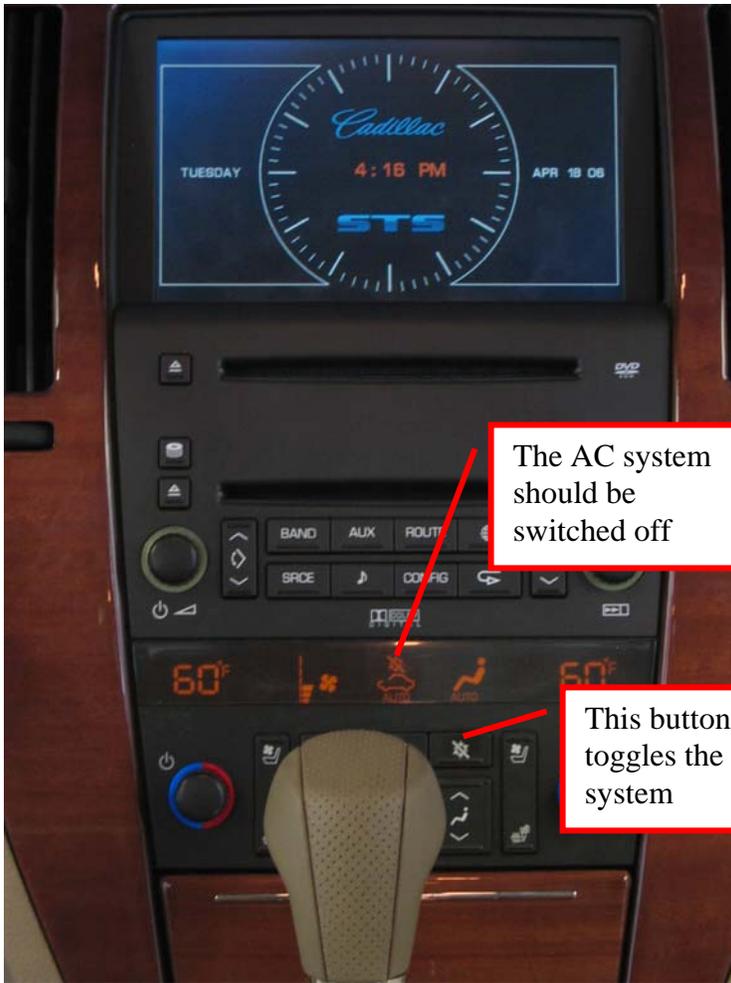

8. After the valve moves to that position (note the EXV Setpoint and Position plots), click the top button to return to Control mode.

Note that this procedure should never be necessary if the system runs normally and the controller code is not reloaded. Note also that whenever the car's engine is switched off (ignition off event), the system goes through an automatic valve rezero operation. The valve is driven to -500 steps, the counter reset to zero and then the valve is opened to the system default valve position.

4. Permanently storing code in the system controller (dSpace MicroAutobox)

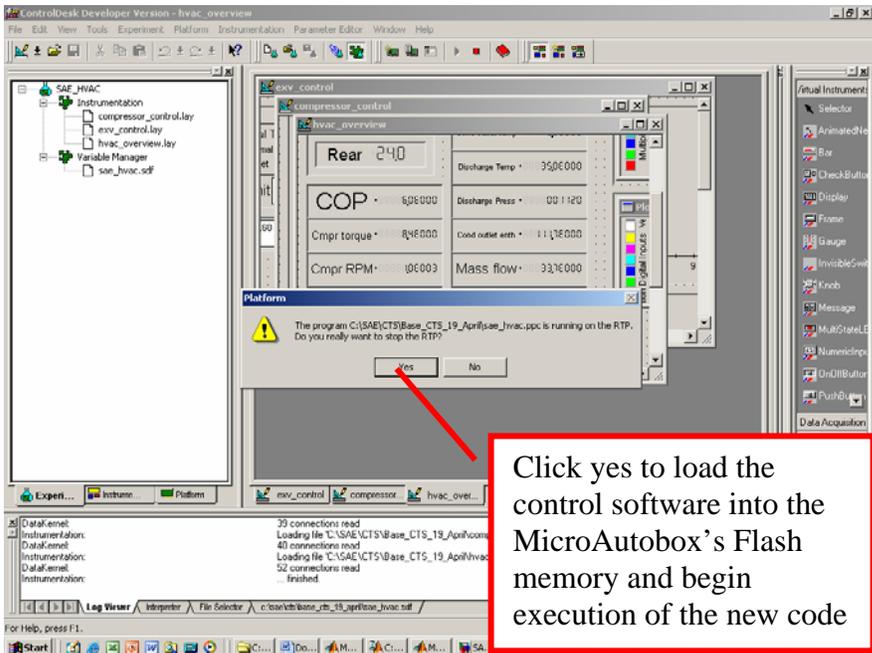

Start ControlDesk (see Topic 1).

The AC system should be switched off

This button toggles the AC system

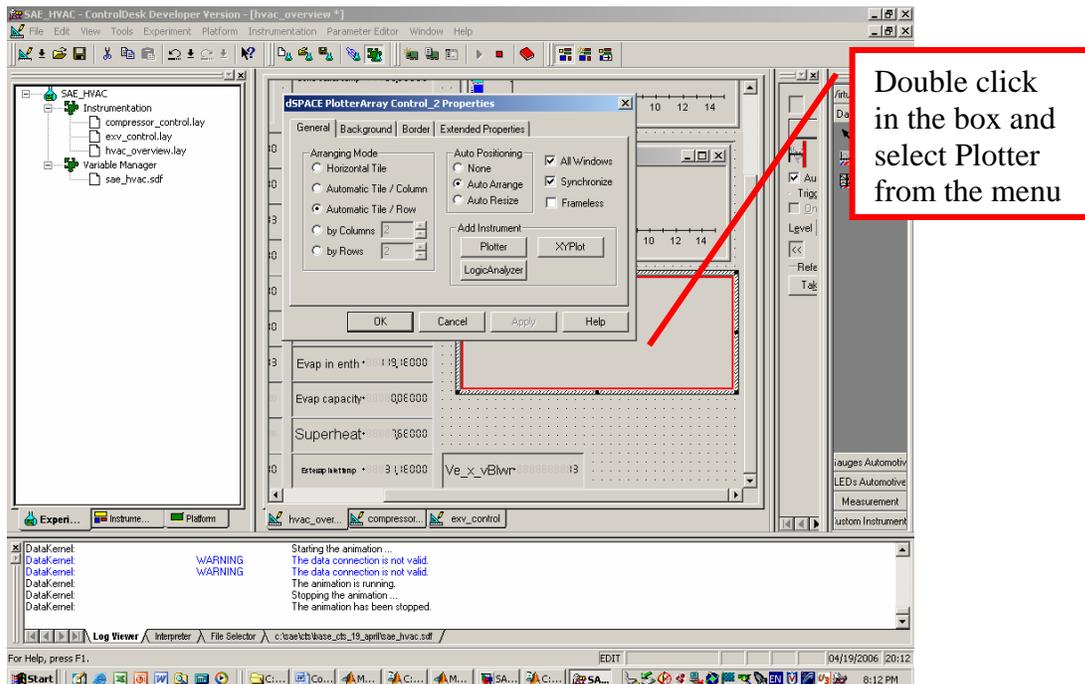

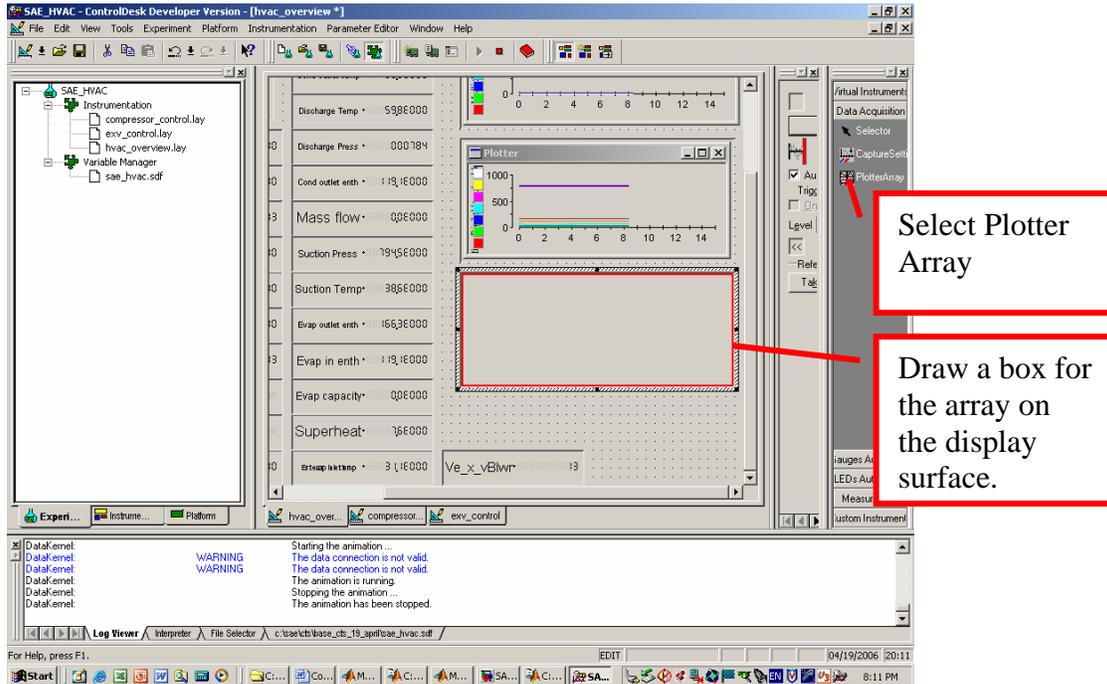

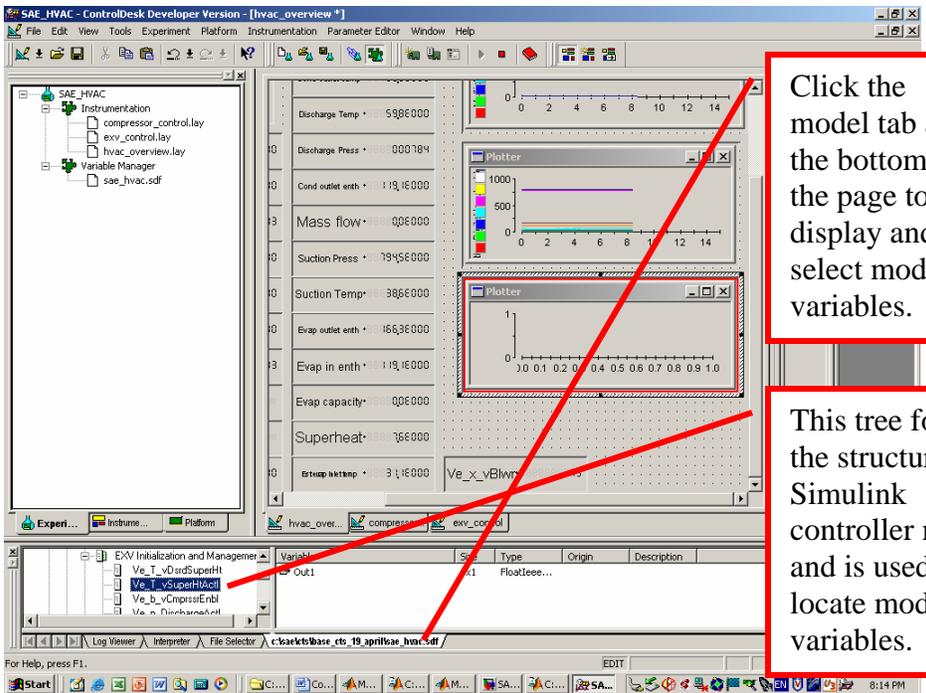

Click yes to load the control software into the MicroAutobox's Flash memory and begin execution of the new code

Note that control is lost during download of code. This is why the AC system should be turned off during code download. After the code has been downloaded and starts running on the MicroAutobox, rezero the EXV (see Topic 3) since its position is sometimes lost when new code is loaded.

5. Setting up instrumentation in dSpace ControlDesk

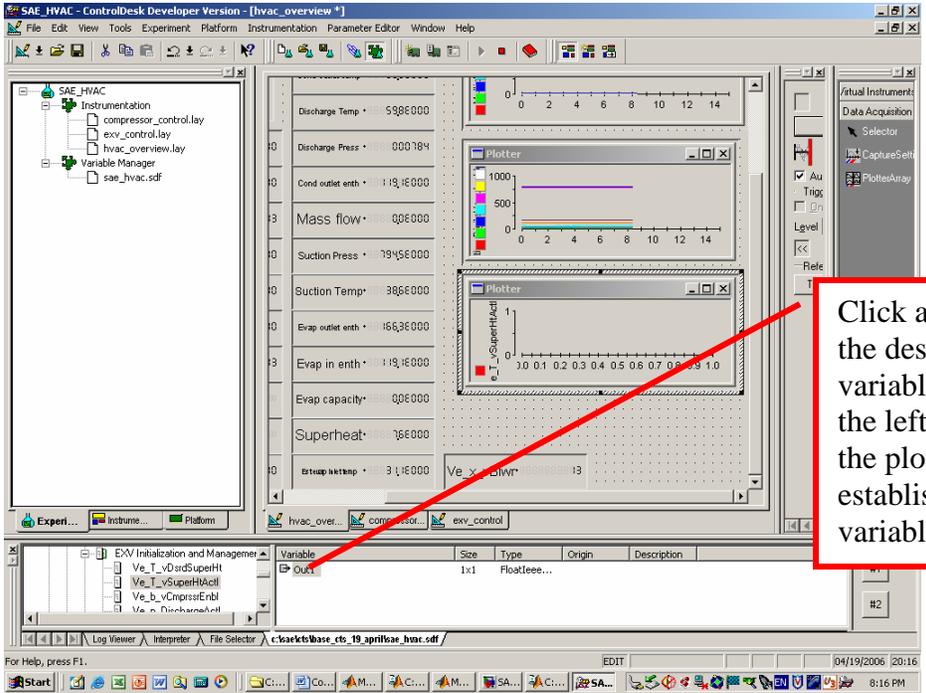

This section illustrates how to set up a plotter array. Other instruments are set up in a similar fashion. It is often convenient to copy and paste an existing instrument.

Click the model tab at the bottom of the page to display and select model variables.

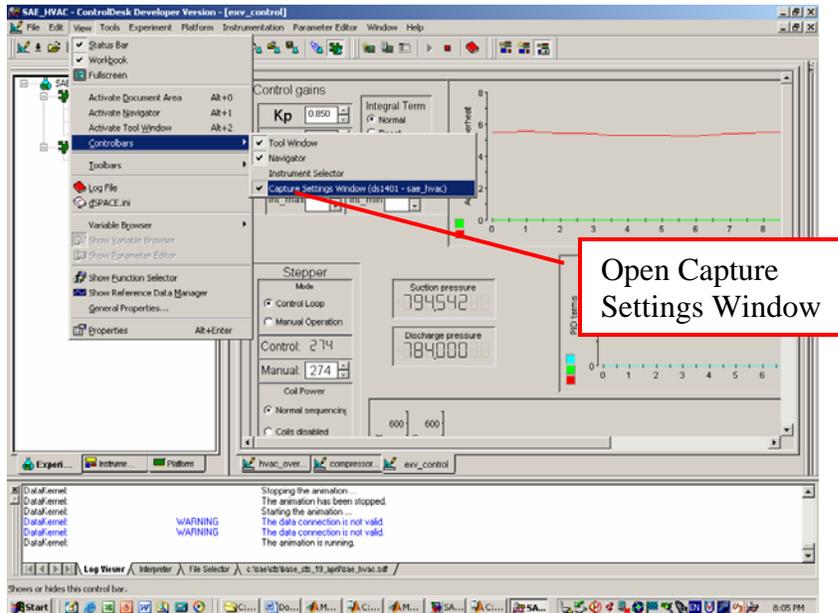

This tree follows the structure of the Simulink controller model and is used to locate model variables.

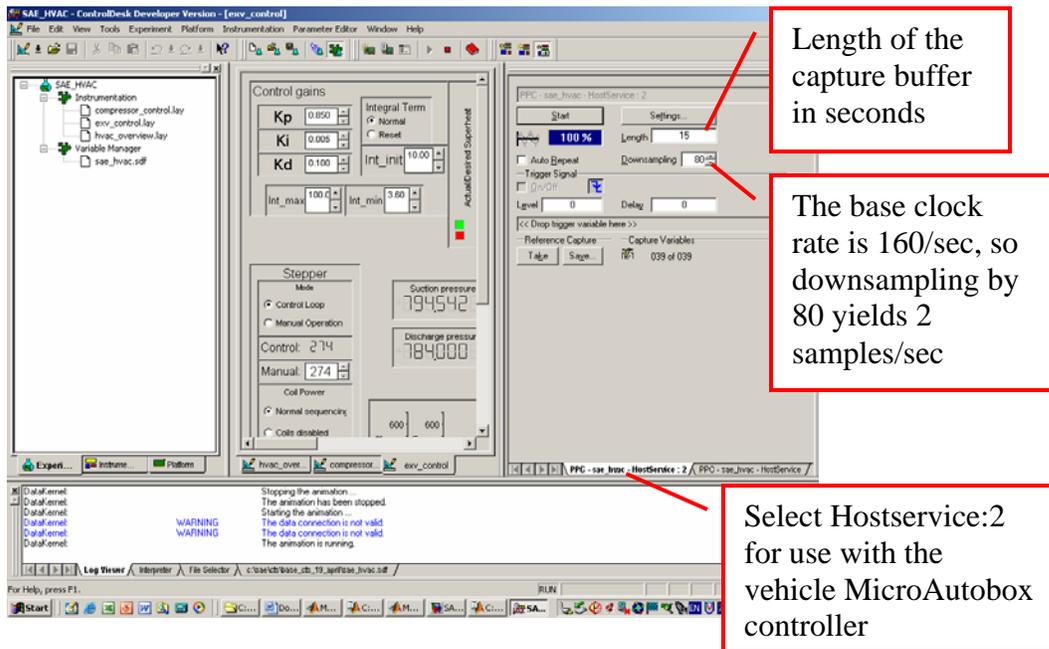

Click and drag the desired variable onto the left side of the plotter to establish the variable link

6. Setting up a data capture in ControlDesk and using the captured data

ControlDesk can capture and save buffers of data. Only data displayed on a plotter will be buffered and saved. To include data on a plotter, see Topic 5. The stored data duration and sample rate is established using the Capture Settings Window.

The Window may be hidden by the display windows, use the Window dropdown menu to locate.

To capture a buffer of data, Auto Repeat should not be checked. (To view normal strip chart displays, check Auto Repeat and set Downsampling to 40 or so.) For a basic scan,

no trigger is selected. Press “Start” to begin the scan. Wait until the buffer is 100% full and press “Save” to write the buffer of data to a file. The file is a MatLab “.mat” file. The data is stored as a structure. (Use simple file names for compatibility with MatLab. In particular do not use a number at the beginning of a file name and do not use characters like ‘-’ or blanks. Use ‘_’ instead of blanks.) CTS has developed a MatLab function “DSpaceExcel.m” that can convert either the entire data file or a portion of the file into an Excel spreadsheet. The function is located in the directory ~\ CTS\ (latest directory data)\data and has been placed under TortoiseSVN version control (see Topic 9). The function runs only under MatLab ver. 7. (The Simulink control program must be compiled under MatLab ver. 6. Both versions of MatLab are available on the HP support computer.) The usage of this function follows (car_data is the *.mat file saved from a dSpace ControlDesk capture):

Usage:

```
load car_data
DSpaceExcel(car_data, 'filename')
```

This exports all the data cleaning up the exported names and printing messages as it works.

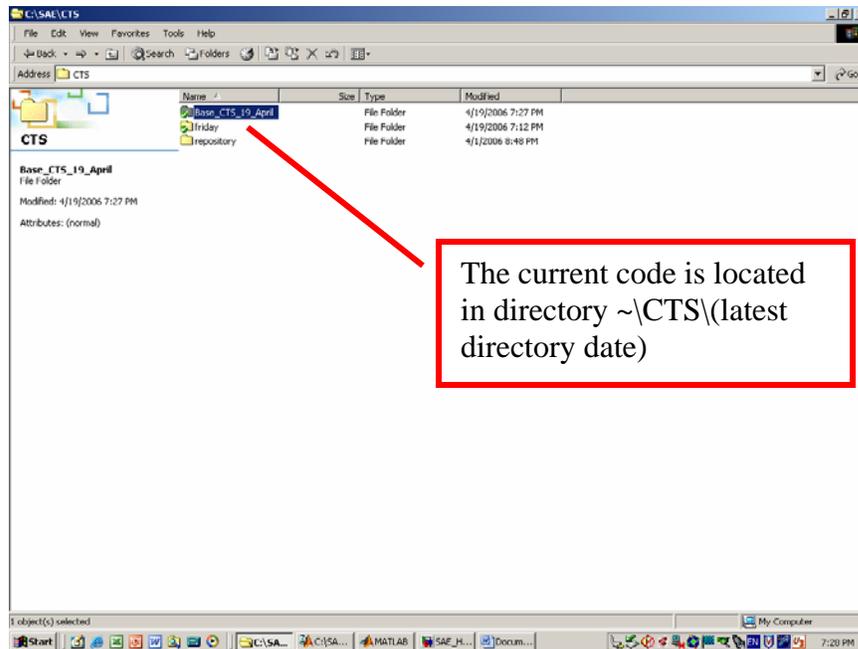

Added features:

```
DSpaceExcel(car_data, 'filename', [2 5 7])
```

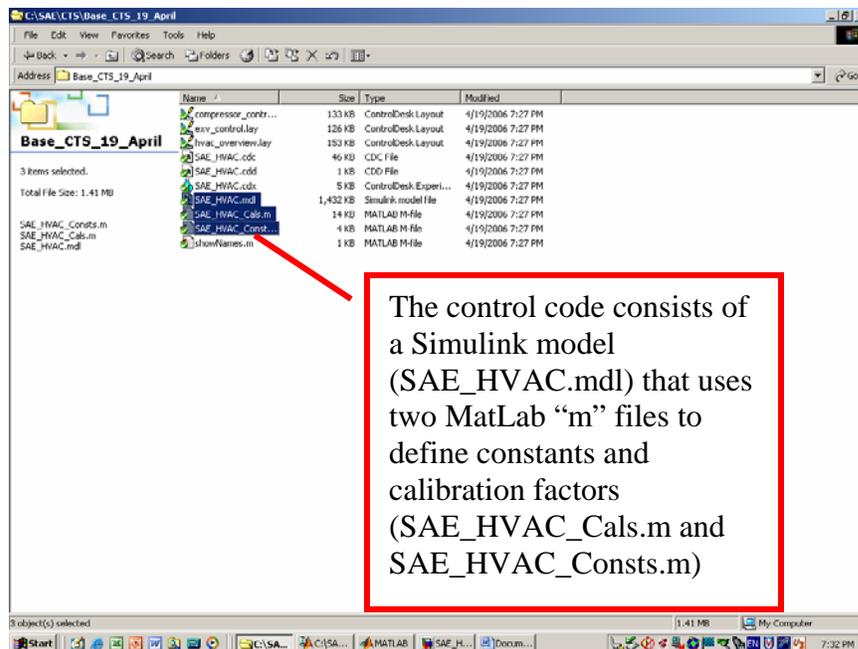

Will only export the second, fifth, and seventh data sets. Use standard Matlab array notation to select which entries you need. For example, [1:5, 10:12] is the same as [1 2 3 4 5 10 11 12].

7. The control system model

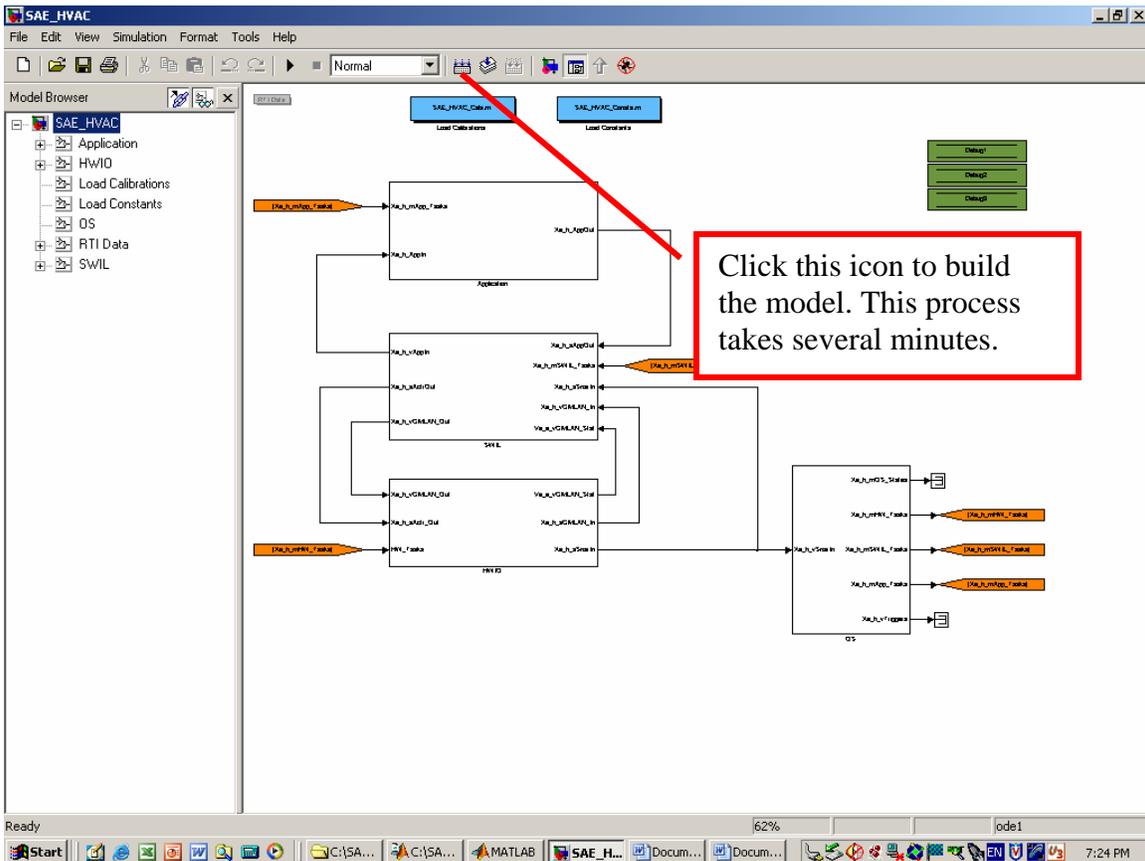

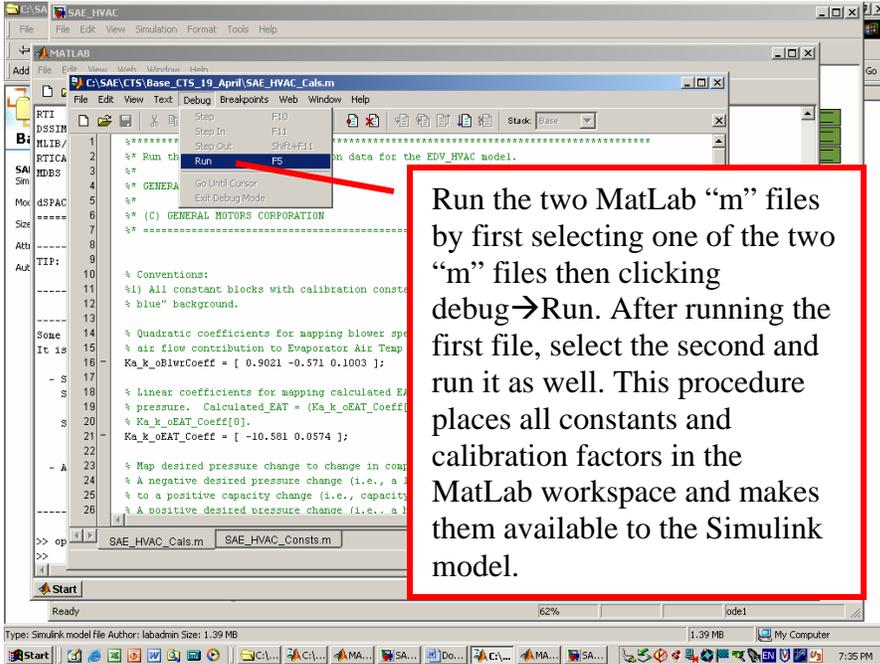

It may be necessary or desirable to modify and recompile the control system model.

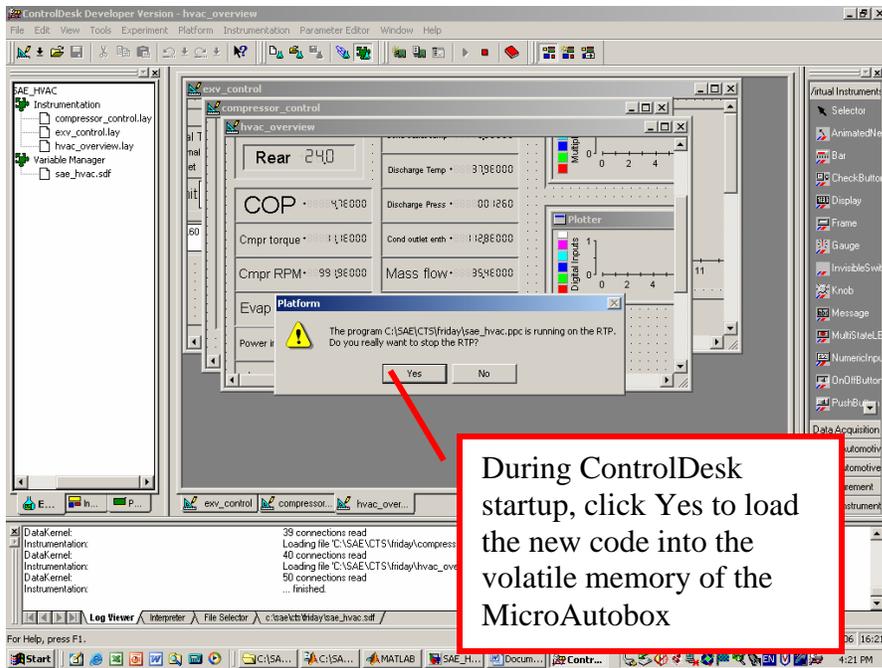

The control code has been placed under source code control (see Topic 9).

Double click on SAE_HVAC.mdl to start MatLab (version 6 – required to generate code for the MicroAutobox) and Simulink. Load SAE_HVAC_Cals and SAE_HVAC_Consts from MatLab.

The code must be loaded into the MicroAutobox controller (see Topics 1 and 4).

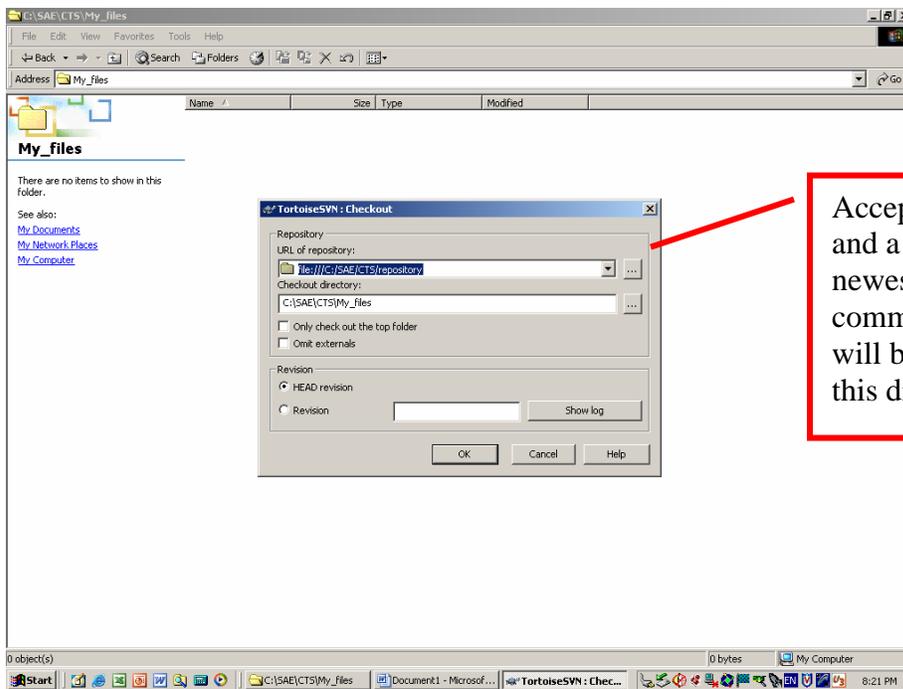

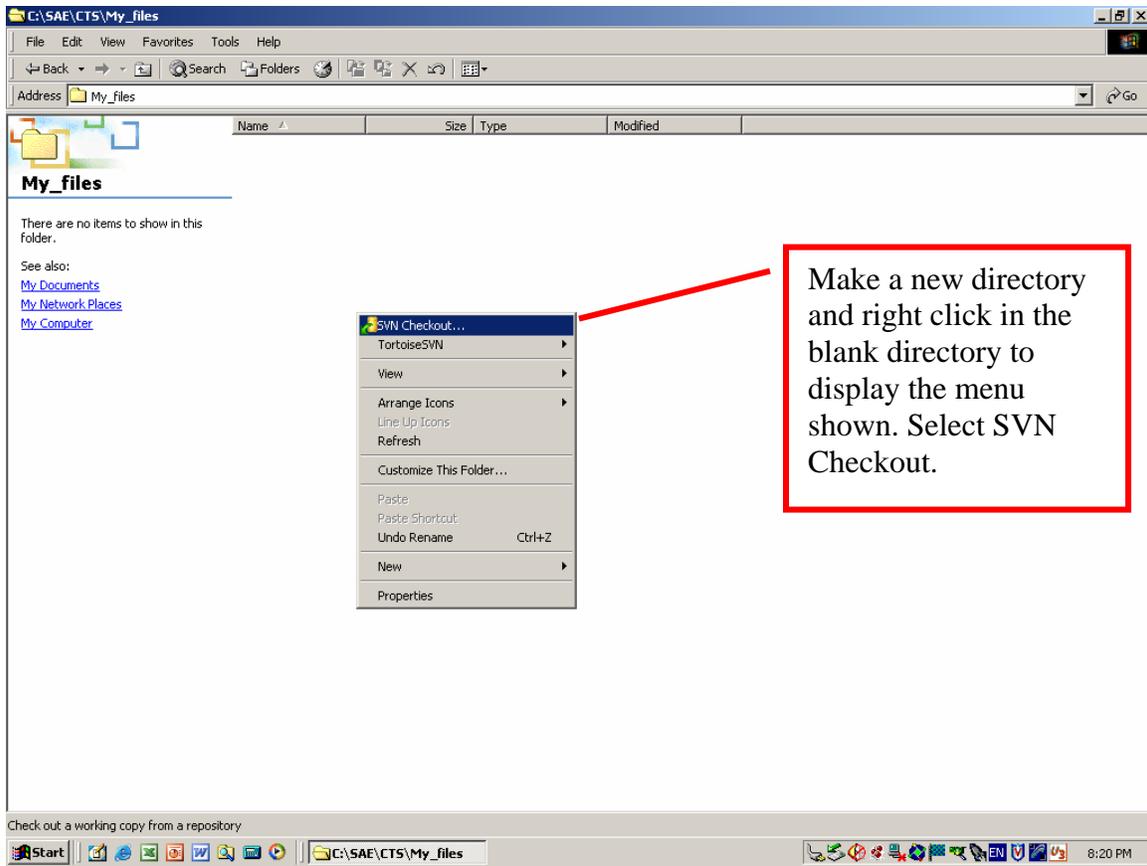

See Topic 4 to load code into the MicroAutobox's FLASH memory. Note that code written only to volatile memory is persistent as long as vehicle battery power is not removed. (It is suggested that vehicle battery power be removed overnight by removing the supply fuse - see Topic 10.)

8. Model variables that may require modification

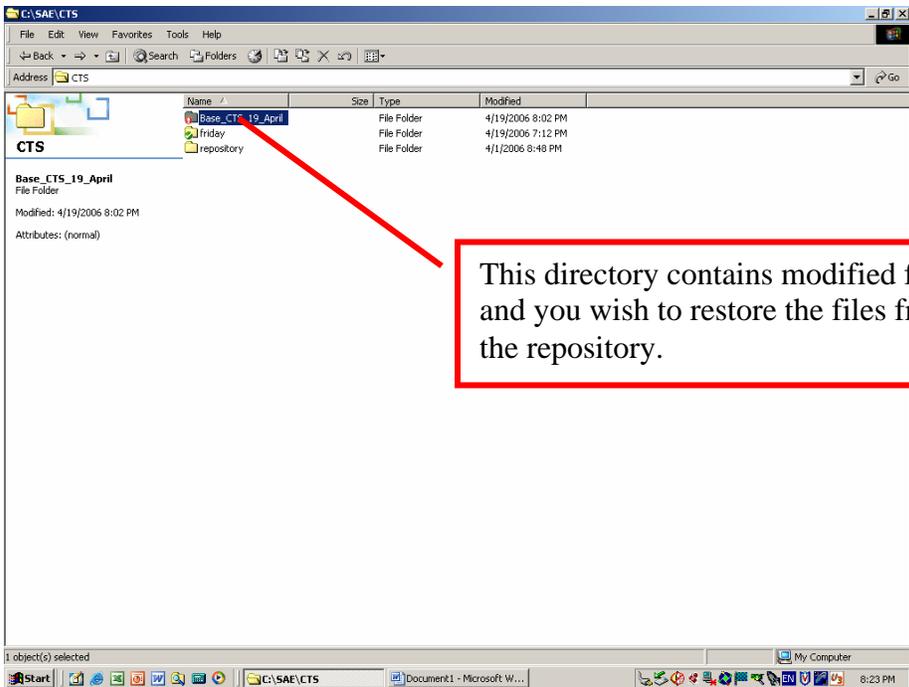

The file SAE_HVAC_Cals.m contains systems calibration constants and setup parameters. You may wish to change some of the values. An effort has been made to place the variables that may need to be modified near the start of the file and to document every variable. Many of them can be modified during runs using dSpace ControlDesk. If a new set of constants are identified during a run using ControlDesk, you will need to modify the constants in SAE_HVAC_Cals.m and recompile and reload the code into the MicroAutobox to make the changes permanent (see Topic 7).

9. Source code control (TortoiseSVN)

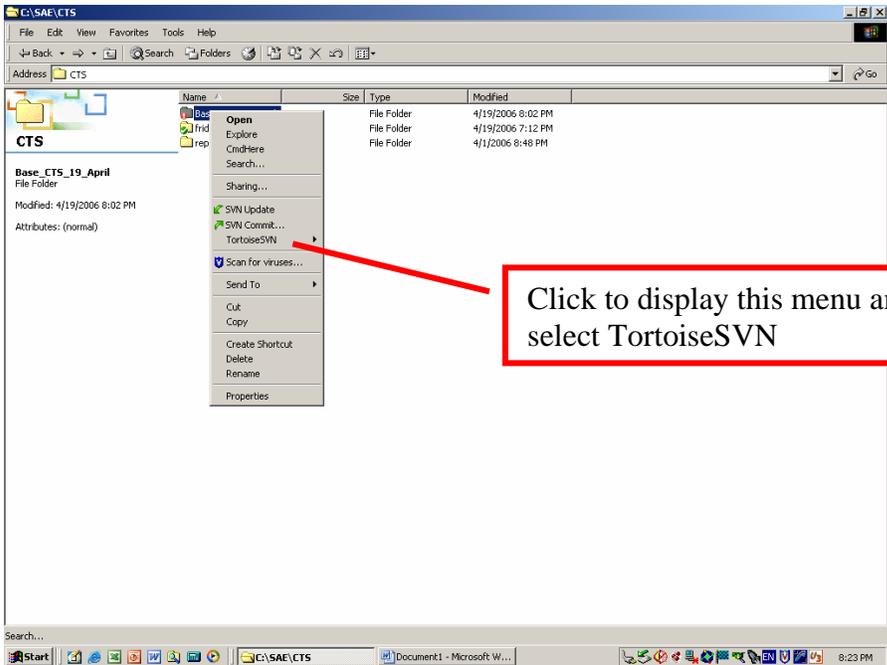

The control code, the dSpace ControlDesk Experiment files, as well as some support files have been placed under source code control using TortoiseSVN. When using Windows Explorer, controlled files (and directories containing controlled files) will usually be indicated by a checkmark (if committed to the repository), or an exclamation point (if the latest version is not yet committed). The source code control system provides a way to return to previous version of the code. In particular, it is important to commit the entire development directory (Base_CTS_19_April at present) before making significant changes in the code. That way, mistakes can be rectified quickly by using the Revert feature of TortoiseSVN. The following shows how to start a new development directory and commit a copy of the code before beginning new development. Reversion to the last version of the code is also illustrated. See the TortoiseSVN help files for the many other features of this software. **Note, the “repository” directory must never be deleted.**

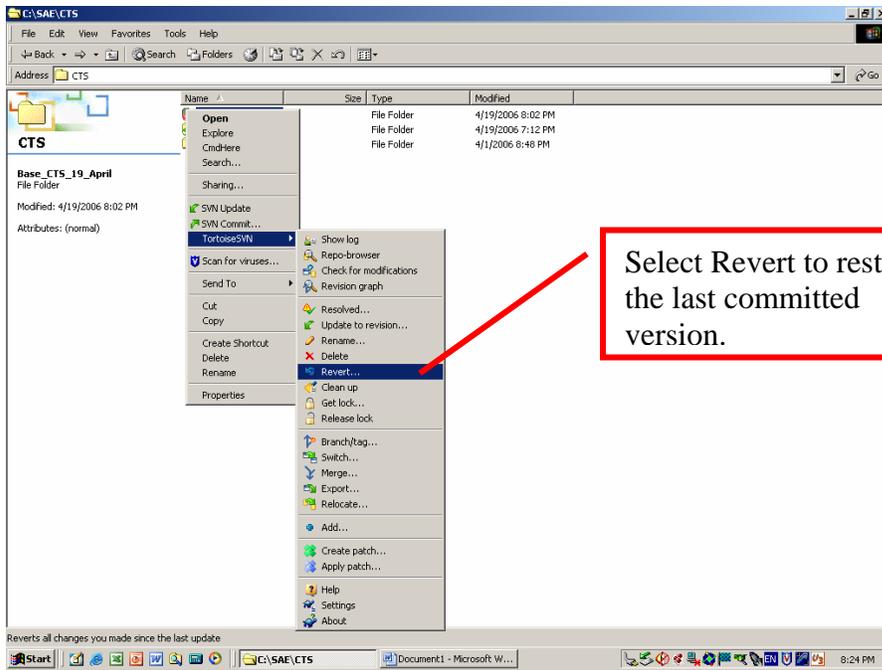

In the case that you wish to revert to a previous version of controlled code:

This directory contains modified files and you wish to restore the files from the repository.

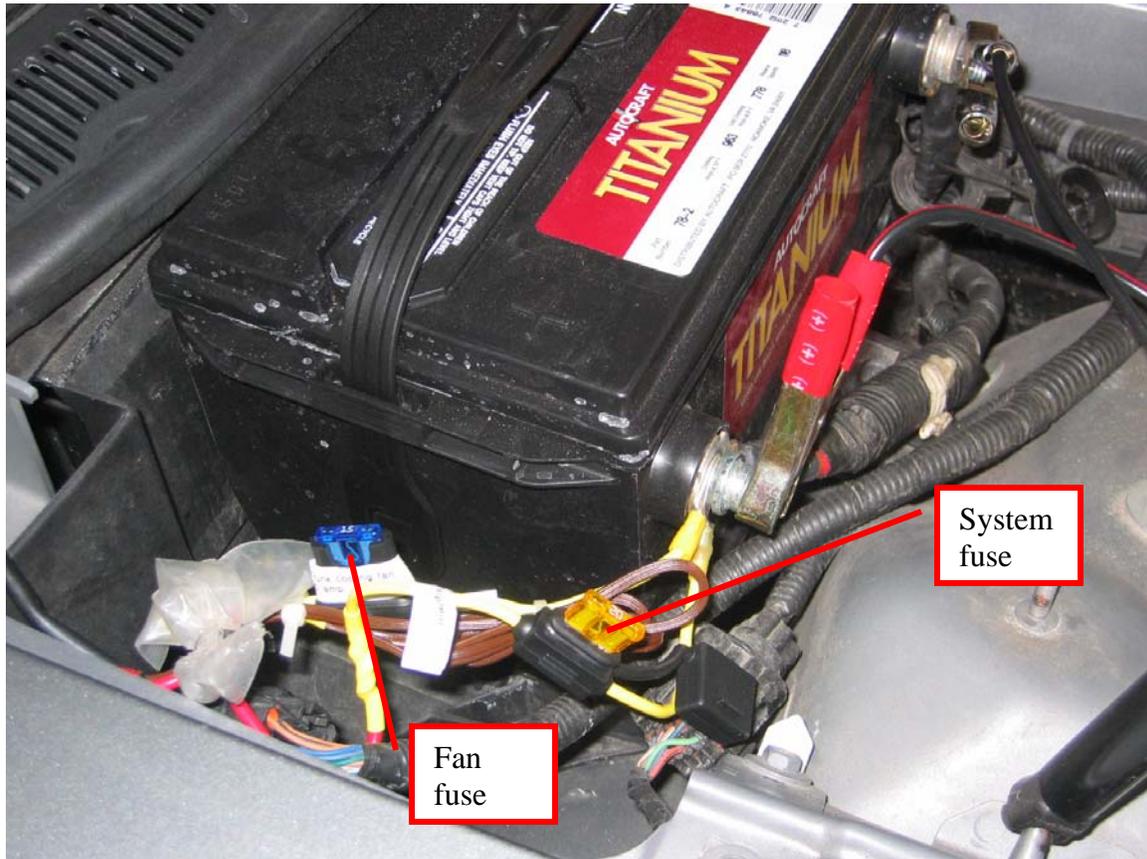

Click to display this menu and select TortoiseSVN

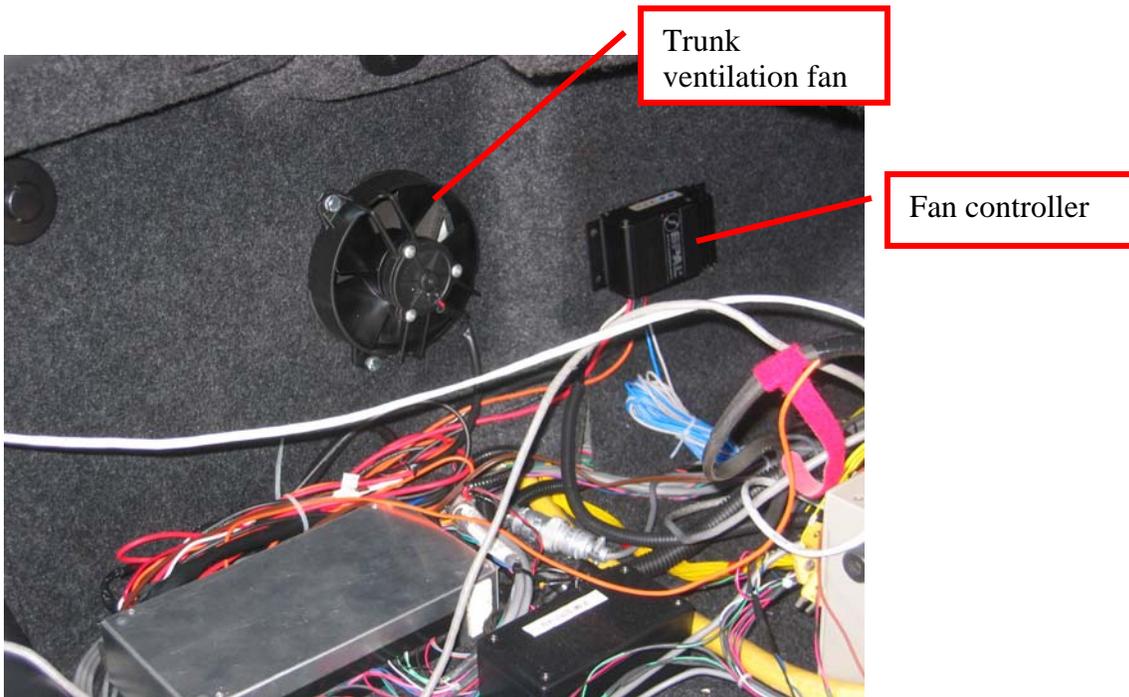

10. Hardware issues

The entire system is powered from a line attached directly to the positive terminal of the vehicle battery. The system draws current sufficient to run down the vehicle battery even when completely shut down. It is suggested that the system fuse be removed when the vehicle is not running for any extended period of time.

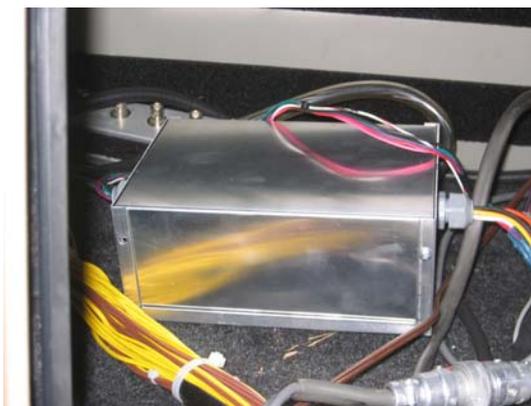

12 Volt battery current consumption when the vehicle ignition is off, the key fob far from the vehicle, and with various loads is:

1. System fuse installed, 9 pin vehicle bus connector in trunk connected and STI system turned on (toggle switch on rear tunnel)– 4.35A
2. System fuse installed, 9 pin bus connector in trunk connected – 0.158 A
3. System fuse installed, 9 pin bus connector in trunk disconnected – 0.135 A
4. System fuse removed, 9 pin bus connector in trunk connected – 0.028 A
5. System fuse removed, 9 pin bus connector in trunk disconnected – 0.044 A

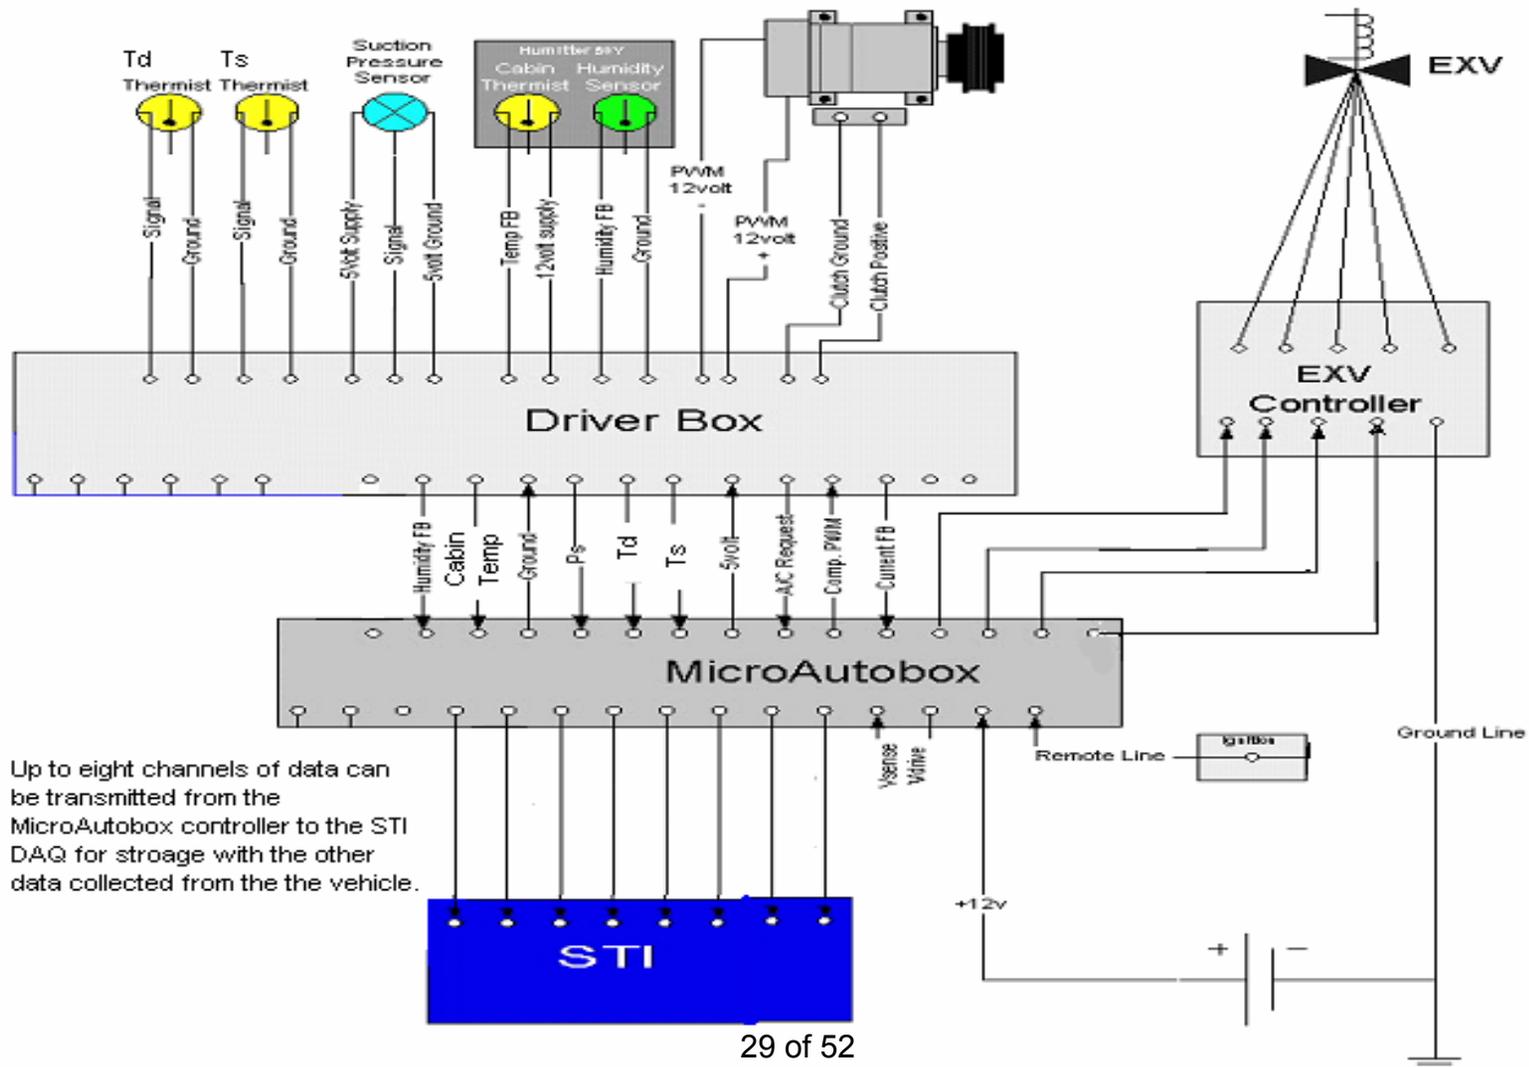

A small SPAL fan (VA31-A101-46S) and controller (FAN-PWM) have been installed to exhaust air from the trunk into the fender vent. Documents that cover the fan and its controller appear in the **Hardware Reference** at the end of this document. The fender vent flap has not been removed or taped open, so improved air flow could be obtained if necessary. Fan power is taken directly from the battery positive terminal (with return grounded on the same ground post on the passenger door upright as the control and data acquisition system). The fan controller is armed with an ignition line. The line is connected to the positive lead of the STI data acquisition system power cable. Thus the fan can only operate when the STI system is powered up. At present the fan starts running at a temperature of 116 F and reaches full velocity at 150 F. The fan can easily be reprogrammed to other temperature thresholds. For further information see the documents in the appendix of go to www.spalusa.com.

The custom Fujikoki stepper motor driver box is located in the trunk, accessible through the opening in the back seat. The driver is documented in the **Hardware Reference** that follows.

System Mechanization

MicroAutobox I/O Connector Pinouts

The I/O connector is a 156-pin Zero Insertion Force (ZIF) connector giving access to the input and output signals provided by MicroAutoBox.

The following illustration shows the pin numbering of the I/O connector (front view of MicroAutoBox):

Note

There are pins identified via capital letters (A, B, C, ...) and pins identified via small letters (a, b, c).

The following table shows the signals of the I/O connector: Pins used highlighted in yellow. Power (+12 Volt vehicle power) highlighted in red. Common (ground) highlighted in black.

I SPECIFICATION

- REFRIGERANT FOR USE: HFC-134a (CF₃CH₂F) + ESTER OIL
- AMBIENT TEMPERATURE: -30~+60°C (COIL DUTY RATIO: 50% MAX.)
- FLUID TEMPERATURE: -30~+60°C (COIL DUTY RATIO: 50% MAX.)
- AMBIENT HUMIDITY: 95% RH MAX.
- ORIENTATION: MOTOR UPSIDE OR TO VERTICAL (±15° MAX.)
- OPERATING PRESSURE: 0~2.75 MPaG
- FLOW DIRECTION: BI-DIRECTIONAL
- INSULATION CLASS FOR COIL: CLASS E
- INSULATION RESISTANCE: 100 MEG-OHM MIN (500V DC MEGGER)
- DIELECTRIC STRENGTH: ENDURES 500V AC X 1 SECOND (OR 500V AC X 1 MINUTE)
- OPERATING VOLTAGE: 12V DC ±10% (AT COIL TERMINALS): REFERENCE
- ELECTRIC CURRENT: 0.35A/PHASE (20°C)
- ACTUATOR: 4-PHASE PERMANENT MAGNET TYPE STEPPING MOTOR (24 POLES) DIRECT-DRIVE
- EXCITATION TYPE: 1-2 PHASE DISTRIBUTION
- PULSE RATE: 83.3PPS
- VALVE PORT DIAMETER: φ3.5
- FULL STROKE LIFTS: 4.13mm
- FULL STROKE PULSE: 680 PULSES
(CAUTION) DO NOT APPLY MORE THAN 700 PULSES TO OPEN THE VALVE FROM THE CLOSED POSITION.
- OPERATING PRESSURE DIFFERENCE: 0~1.97MPa
- MAXIMUM PRESSURE DIFFERENCE TO OPEN VALVE WHEN BACK PRESSURE APPLIED: 1.27MPa (B→A)
- SWITCHING MODE & VALVE MOVEMENT

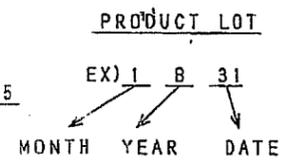

PHASE No.	LEAD WIRE COLORS	SWITCHING MODE							
		1	2	3	4	5	6	7	8

Omega OM5-IMV-100A-C voltage isolation module installed on OM5-BP-SKT-C board. Module converts 0 to 100 mV voltage across the sense resistor (created by 0 to 1 A current) to 0 to 5 volts signal for input to MicroAutobox. Module include 4 Hz filter to smooth the pulse width modulated current signal.

CTS - Urbana, Illinois		
Title		
Compressor Driver and Current Sense		
Size	Document Number	Rev
A	CTS_030	1
Date:	Tuesday, July 25, 2006	Sheet 1 of 1

Installation of current sense measurement circuit (isolation amplifier)

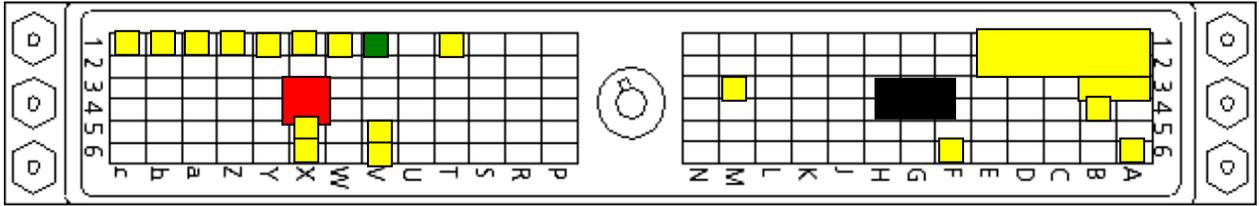

Install OM5-IMV-100A-C module on the OM5-BP-SKT-C board and connect as shown below. An explanation of certain connections follows the diagram.

See the “Compressor Driver and Current Sense” schematic diagram for connection across the current sense resistor. The current sense resistor is located in an external plastic enclosure.

Jumper J1 should not be installed for this application.

The conditioned current sense resistor voltage signal should go to pin V1 on the MicroAutobox connector. Remove the big connector of the front of the MicroAutobox, you can see how the pins are arranged (see the following diagram).

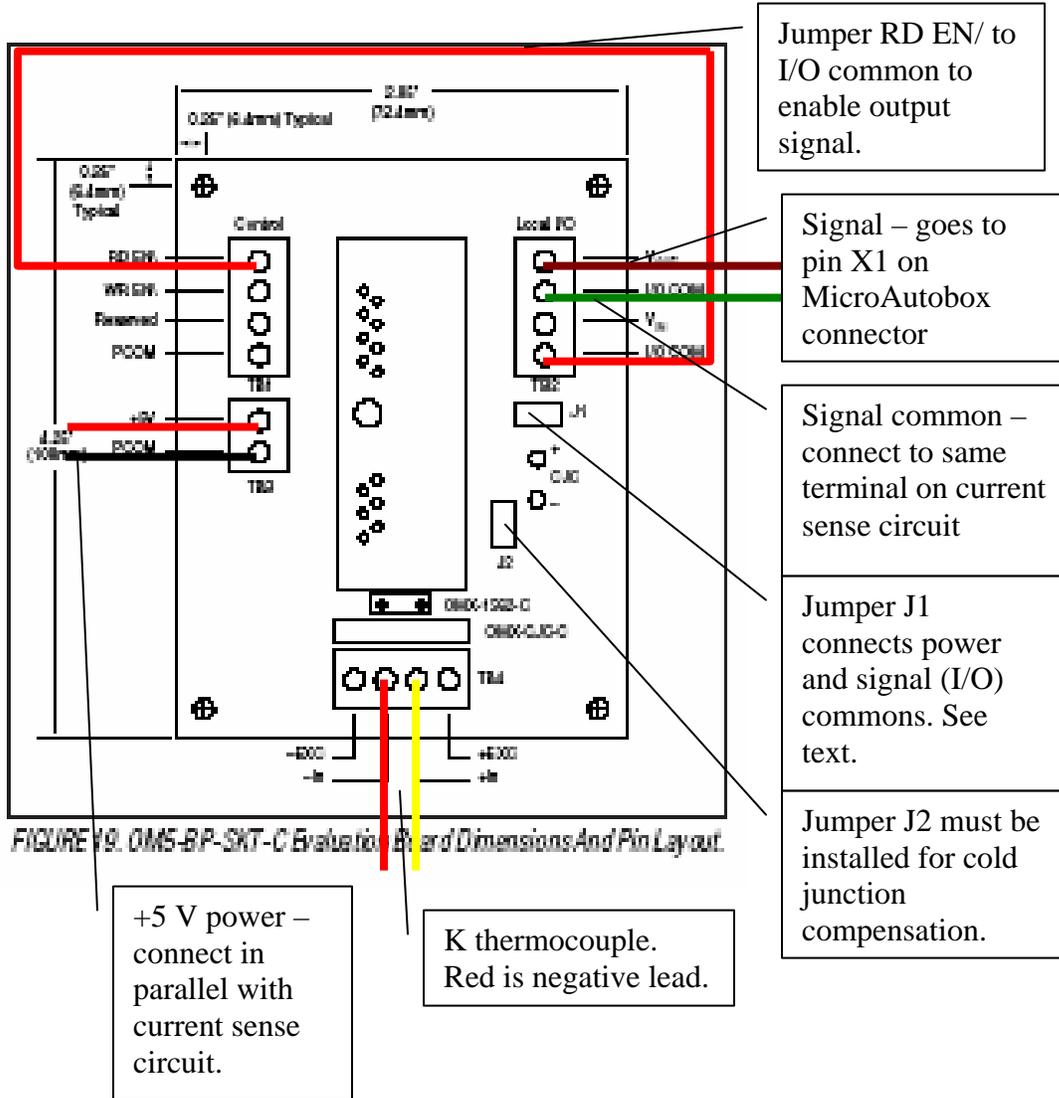

You should be able to remove the MicroAutobox connector and figure out the pinout from the diagram above (note looking into the connector will be a mirror image of the above – the pins are arranged as shown when looking at the back of the connector after removing its shell. The power and ground pins are shown in red and black respectively. The green pin is the one we are adding. You will have to remove the connector shell. Crimp a pin to a new wire and attach to terminal Vout of the OM5-BP-SKT-C board.

You can go to the dSpace help files and see the instructions on how to take off the connector shell and crimp and install a new pin. (Search for the topic “How to Build the Connector”.)

The OM5-IMV-100A-C module converts the 0 – 100 mV signal across the current sense resistor (100mV corresponds to 1 A) to a 0 to 5 volt signal. The MicroAutobox converts the 0 to 5 volt signal to a number between 0 and 1. Thus the signal measured by the MicroAutobox reads directly in Amps.

Installation of K thermocouple for measurement of compressor outlet temperature.

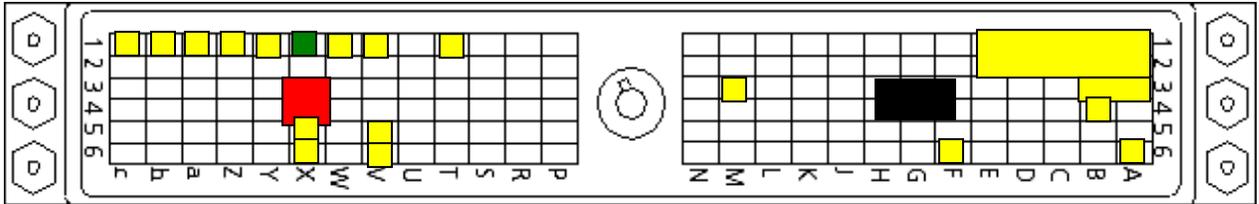

Install OM5-LTC-K2-C module on the OM5-BP-SKT-C board and connect as shown below. An explanation of certain connections follows the diagram.

The “Compressor Outlet Pipe Temp” thermocouple was wire 38 plugged into physical channel number 26 of the STI data acquisition system.

The installation of jumper J1 depends on the ground status of the thermocouple. Use a DVM to check continuity between one of the thermocouple leads and chassis ground (available in the plastic power distribution box in the floor of the trunk near the bumper). If there is low resistance to chassis ground, do not install jumper J1. If the resistance is larger than, say, 20,000 Ohms, do install the jumper.

The conditioned thermocouple signal should go to pin X1 on the MicroAutobox connector. Remove the big connector of the front of the MicroAutobox, you can see how the pins are arranged (see the following diagram).

You should be able to remove the MicroAutobox connector and figure out the pinout from the diagram above (note looking into the connector will be a mirror image of the above – the pins are arranged as shown when looking at the back of the connector after removing its shell. The power and ground pins are shown in red and black respectively. The green pin is the one we are adding. You will have to remove the connector shell. Crimp a pin to a new wire and attach to terminal Vout of the OM5-BP-SKT-C board.

You can go to the dSpace help files and see the instructions on how to take off the connector shell and crimp and install a new pin. (Search for the topic “How to Build the Connector”.)

The OM5-LTC-K2-C module converts the thermocouple signal to a voltage such that 0 to 500C maps into 0 to 5 volts. The MicroAutobox converts the 0 to 5 volt signal to a number between 0 and 1. This can be checked in the dSpace software. The signal is read by the dSpace system in the software module HWIO, DS1401 Analog Inputs – Mod Spd1. Right click on the ADC_TYPE1_M1_CON2 block and select help. The help topic will tell you the input voltage to internal units mapping. Assuming the 5 volts maps to 1, the conversion relationship between *conversion* and temperature is just:

$$T = (\textit{conversion}) \bullet 500 \text{ } ^\circ\text{C}$$

OM5-WMV/WV

Analog Voltage Input Modules, Wide Bandwidth

FEATURES

- ACCEPTS MILLIVOLT AND VOLTAGE LEVEL SIGNALS
- HIGH LEVEL VOLTAGE OUTPUTS
- 1500Vrms TRANSFORMER ISOLATION
- ANSI/IEEE C37.90.1-1989 TRANSIENT PROTECTION
- INPUT PROTECTED TO 240VAC CONTINUOUS
- 100dB CMR
- 10kHz SIGNAL BANDWIDTH
- $\pm 0.05\%$ ACCURACY
- $\pm 0.02\%$ LINEARITY
- $\pm 1\mu\text{V}/^\circ\text{C}$ DRIFT
- CSA CERTIFIED, FM APPROVED, CE COMPLIANT
- MIX AND MATCH OM5 TYPES ON BACKPANEL

DESCRIPTION

Each OM5 wide bandwidth voltage input module provides a single channel of analog input which is amplified, isolated, and converted to a high level analog voltage output (Figure 1). This voltage output is logic-switch controlled, allowing these modules to share a common analog bus without the requirement of external multiplexers.

The OM5 modules are designed with a completely isolated computer side circuit which can be floated to $\pm 50\text{V}$ from Power Common, pin 16. This complete isolation means that no connection is required between I/O Common and Power Common for proper operation of the output switch. If desired, the output switch can be turned on continuously by simply connecting pin 22, the Read-Enable pin to I/O Common, pin 19.

The input signal is processed through a pre-amplifier on the field side of the isolation barrier. This pre-amplifier has a gain-bandwidth product of 5MHz and is bandwidth limited to 10kHz. After amplification, the input signal is chopped by a proprietary chopper circuit. Isolation is provided by transformer coupling, again using a proprietary technique to suppress transmission of common mode spikes or surges. The module is powered from +5VDC, $\pm 5\%$.

A special input circuit provides protection against accidental connection of power-line voltages up to 240VAC.

OM5-LTC

Linearized Thermocouple Input Modules

FEATURES

- INTERFACES TO TYPES J, K, T, E, R, S, N, AND B THERMOCOUPLES
- LINEARIZES THERMOCOUPLE SIGNAL
- HIGH LEVEL VOLTAGE OUTPUTS
- 1500Vrms TRANSFORMER ISOLATION
- ANSI/IEEE C37.90.1-1989 TRANSIENT PROTECTION
- INPUT PROTECTED TO 240VAC CONTINUOUS
- 160dB CMR
- 95dB NMR AT 60Hz, 90dB AT 50Hz
- $\pm 1\mu\text{V}/^\circ\text{C}$ DRIFT
- CSA CERTIFIED, FM APPROVED, CE COMPLIANT
- MIX AND MATCH OM5 TYPES ON BACKPANEL

DESCRIPTION

Each OM5-LTC thermocouple input module provides a single channel of thermocouple input which is filtered, isolated, amplified, linearized and converted to a high level analog voltage output (Figure 1). This voltage output is logic-switch controlled, allowing these modules to share a common analog bus without the requirement of external multiplexers.

The OM5-LTC modules are designed with a completely isolated computer side circuit which can be floated to $\pm 50\text{V}$ from Power Common, pin 16. This complete isolation means that no connection is required between I/O Common and Power Common for proper operation of the output switch. If desired, the output switch can be turned on continuously by simply connecting pin 22, the Read-Enable pin to I/O Common, pin 19.

The OM5-LTC can interface to eight industry standard thermocouple types: J, K, T, E, R, S, N, and B. Its corresponding output signal operates over a 0V to +5V range. Each module is cold-junction compensated to correct for parasitic thermocouples formed by the thermocouple wire and screw terminals on the mounting backpanel. Upscale open thermocouple detect is provided by an internal pull-up resistor. Downscale indication can be implemented by installing an external $47\text{M}\Omega$ resistor, $\pm 20\%$ tolerance, between screw terminals 1 and 3 on the OM5-BP backpanels.

Signal filtering is accomplished with a six-pole filter which provides 95dB of normal-mode-rejection at 60Hz and 90dB at 50Hz. Two poles of this filter are on the field side of the isolation barrier, and the other four are on the computer side.

After the initial field-side filtering, the input signal is chopped by a proprietary chopper circuit. Isolation is provided by transformer coupling, again using a proprietary technique to suppress transmission of common mode spikes or surges. The module is powered from +5VDC, $\pm 5\%$.

A special input circuit provides protection against accidental connection of power-line voltages up to 240VAC.

OM5-BP-SKT-C ANALOG MODULE EVALUATION BOARD

DESCRIPTION

The OM5-BP-SKT-C is a single channel board with a test socket for OM5 module evaluation (Figure 19). All signal input/output, control, and power connections are connected to terminal blocks for ease of user access. A cold junction temperature sensor circuit is included for evaluation of thermocouple modules. (See Figure 20 for schematic).

The OM5-BP-SKT-C is mechanically compatible with DIN rail mounting using the following elements:

- 2 OM7-DIN-SF base elements with snap foot
- 2 OM7-DIN-SE side elements
- 4 OM7-DIN-CP connection pins

Two jumpers are provided for customer use. The first, J1, provides a current path between +5V Power Common (module pin 16) and I/O Common (module pin 19). A path must exist between the host control logic power common and module I/O Common for proper operation of the module output switch or track-and-hold circuit. If this connection exists elsewhere in the system, jumper J1 should be removed since possible ground loops could exist. Other connections of power ground and signal ground usually occur at the A/D or D/A converter of the host measurement system.

Jumper J2 is used in the cold junction compensation circuit. If it is installed, the compensation circuit is enabled and will provide the proper compensation voltage to correct for the thermoelectric effect at the +In and -In screw terminals. If an external simulation voltage is desired for cold junction compensation, J2 should be removed. The external voltage is applied at the sockets labeled CJC+ and CJC-. An external voltage of 510.0 mV corresponds to an ambient temperature of +25 °C. The transfer function of the onboard compensation circuit is $V_{CJC} = 0.510 - 0.0025(T-25)V$.

SPAL USA

LIMITED WARRANTY STATEMENT

SPAL USA warrants this product to be free from defects in material and workmanship for a period of eighteen (18) months from the date of sale to the original purchaser. SPAL USA will repair this product free of charge if, in the judgment of SPAL USA, it has been proven defective within the warranty period. The product should be returned, at the customer expense, to the location of original purchase. This warranty does not cover any expenses incurred in the removal and/or reinstallation of the product.

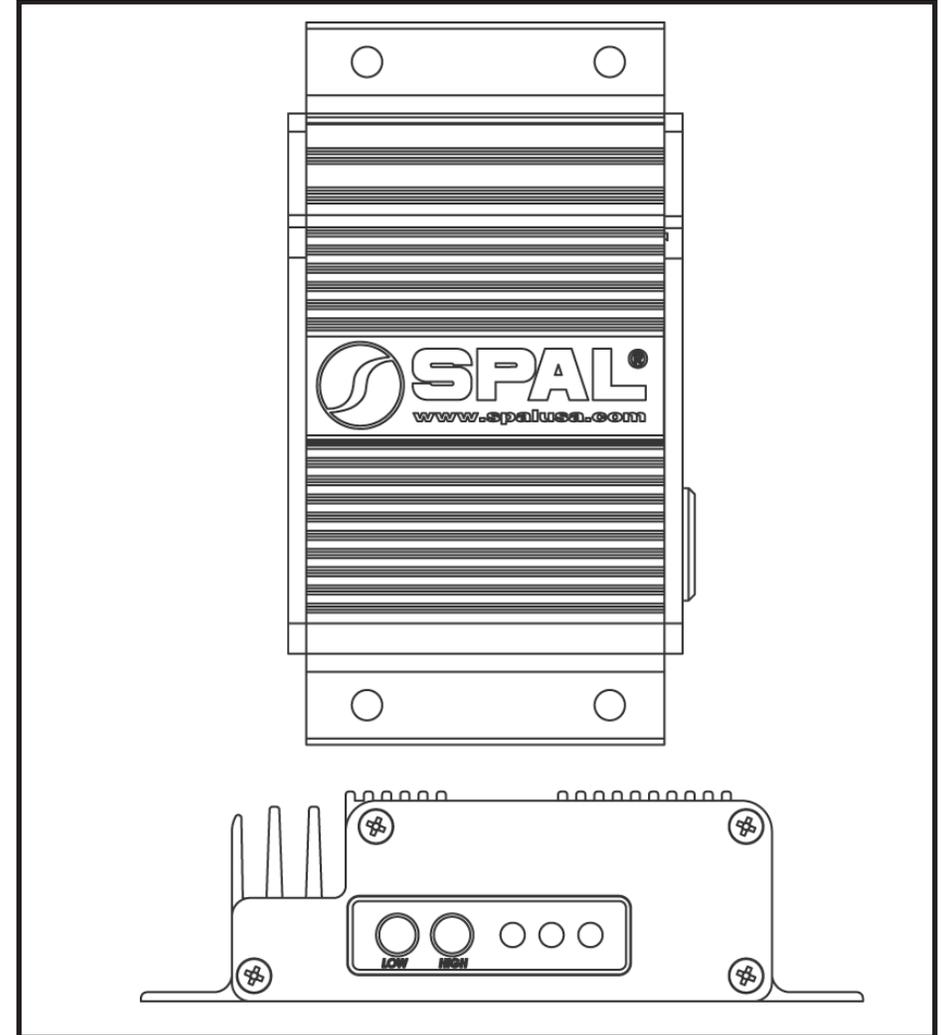

This warranty does not apply to any product damaged by improper installation, misuse, abuse, improper line voltage, fire, flood, lightning, or other acts of God, or a product altered or repaired by anyone other than SPAL USA.

This warranty is in lieu of other warranties, expressed or implied, including any implied warranty of merchantability. No person is authorized to assume for SPAL USA any other liability concerning the sale of this product.

IMPORTANT-KEEP YOUR INVOICE WITH THIS WARRANTY STATEMENT!

FAN-PWM

INSTALLATION INSTRUCTIONS

The SPAL Electric Fan Controller (FAN-PWM) will Pulse Width Modulate a single SPAL electric fan allowing the unit to vary the fan speed based on engine temperature. A second fan can be added with the use of an additional fan wiring kit (SPAL part number FRH). The second fan will not be PWM controlled; it will be ON/OFF only.

Low Setting

When the Low setting is reached the yellow LED will light and the fan will run at 100% for 1/2 second to get the fan rotating. After the initial kick-start, the fan will run at 50%, or 1/2 speed.

High Setting

When the High setting is reached the red LED will light and the fan will run at 100%, or full speed, until the engine cools to the point that the fan can lower its speed. When the red LED lights, a negative output will also be sent on the grey wire. This is used to trigger a secondary fan relay.

Wiring

The SPAL Electric Fan Controller is waterproof and can be mounted inside the vehicle or the engine compartment.

Mount the Fan Controller away from high heat sources such as engine exhaust. A wheel well, the radiator support, or the firewall are good mounting locations.

Single Fan

Please see Single Fan wiring instructions on pages 5-8.

Dual Fan

A dual fan set-up requires a Fan Relay Harness (SPAL part number FRH) to power the secondary fan.

Please see Dual Fan wiring instructions on pages 9-12.

Factory (OEM) Temperature Sensor

The SPAL Fan Controller can be connected to the factory (OEM) temperature sensor or an aftermarket electric gauge sensor. This eliminates the need for an additional sensor. (The FAN-PWM is designed to use the OEM factory type sensor on fuel-injected vehicles. Some older style sensors will not work.)

-If using the factory OEM style sensor, the SPAL Fan Controller must be programmed.

-Please see the programming section on pages 3 and 4.

SPAL Temperature Sensor (FAN-PWM-TS)

If your vehicle is not equipped with an OEM temperature sensor, you can purchase a SPAL temperature sensor that plugs directly into the Fan Controller.

This sensor should be located in the engine head or intake manifold for optimal performance.

-When using the SPAL temperature sensor, the Fan Controller is preset from the factory with a Low setting of 160°, and a High setting of 200°.

-If different settings are required, please see the programming section on pages 3 and 4.

If you are using Air Conditioning you can connect the Blue wire to the 12V wire of the air conditioning compressor. When the compressor turns on, the fan(s) will run at 100%. and the green LED will light.

Unused Wires

Depending on your specific system, you may have extra wires that are not being used. These wires can be coiled and contained in a non-conspicuous location. Or for a cleaner installation the unused wires may be cut. However, if cutting the wires, be sure to cover the ends of the wires with electrical tape or equivalent.

Suggested Fuse Values

The fusing of the FAN-PWM is dependent upon the size and style of fan used. Please reference the suggested fuse values table on Page 13.

Programming Section

LED's:

Red: Indicates high temperature setting has been reached.

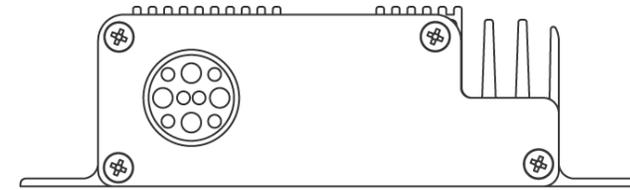

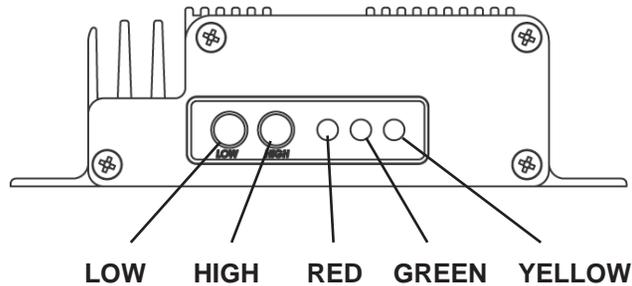

- Fan(s) run at full speed.

Yellow: Indicates low temperature setting has been reached.

- Fan starts at half-speed and increases until high temperature setting is reached.

Green: Indicates the Air Conditioning has been powered ON.

- Fan(s) run at full speed.

WIRE HARNESS CONNECTOR

Programming

****The fan must remain unplugged during programming.****

- Unplug fan.
- Start vehicle.
- Allow engine to warm-up to desired "low" temperature.
- Once temperature has been reached, press and hold the "Low" button for 3 seconds to set the "low temperature."
- Yellow LED will light.
- When desired "high temperature" setting is reached, press and hold the "High" button for 3 seconds.
- Red LED will light.
- Programming is complete. Turn off ignition.
- Allow vehicle to cool.
- Plug in your fan.
- Start vehicle and confirm the fan turns on at the correct temperatures.

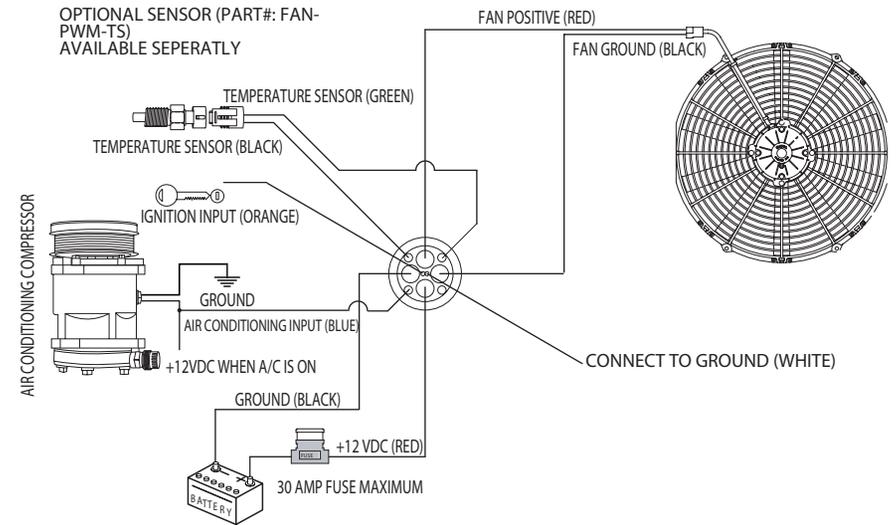

Example

If you want your fan to spin at half-speed at 160 degrees, and spin at full-speed at 200 degrees, you would:

- Unplug fan.
- Warm-up vehicle to 160 degrees.
- Press and hold Low Button for 3 seconds.
- Yellow LED lights
- Continue to warm-up vehicle to 200 degrees.
- Press and hold High Button for 3 Seconds.
- Red LED lights
- Turn off the vehicle.
- Allow vehicle to cool.
- Plug in your fan.
- Start vehicle and confirm the fan turns on at the correct temperatures.
